

Internet Programming

CO4 AT2 - Class Test

Name Deepak Course Code: CSA4305
Reg. No. 192411021

I) Fundamental Concepts Used in Web Development:

i) XML, XML Schema Parser:

XML stores and exchanges structured data between applications, while XML Schema defines the rules for valid XML data.

- XML stores and exchanges structured data
- XML Schema defines valid elements, attributes and data types
- Parser reads and interprets XML documents

ii) JSP & PHP:

JSP and PHP are server-side technologies used to create dynamic interactive web apps.

- JSP is a Java-based technology for dynamic web pages.
- PHP is a server-side scripting language
- Both process user requests.

iii) MVC Architecture & JSTL

MVC separates an application into Model, View, controller, while JSTL simplifies JSP development.

- Model manages data
- View displays information
- Controller handles requests.
- JSTL provides predefined tags for tasks.

iv) XSLT & Database Connectivity?

XSLT transforms XML data, while database connectivity allows applications to communicate with databases.

- XSLT can transform XML into HTML
- Database connectivity links the app with a Database.

Interconnection of Technologies in a web app:

i) XML → Schema → Parser:

XML, XSD, and parsers work together to provide structured and usable data.

→ XML stores data in a structured format

→ XSD validates the structure and data types

ii) JSP / PHP → Server-side Processing:

JSP and PHP process requests on the server and generate responses.

→ User sends a request through a web browser.

→ JSP or PHP processes the request on server

→ Server-side code can access required data.

III) MVC -> Application Organization:

MVC organizes the application by separating data, presentation, and request handling.

- > Model manages data
- > View displays the output.
- > Controller receives requests and coordinates App.

IV) Database Connectivity + XSLT/JSTL:

Database Connectivity retrieves data, while XSLT and JSTL help process and display it appropriately.

- > Database stores application info
- > Database connectivity retrieves or updates required data
- > XSLT can Transform XML data into a suitable format.
